## SATELLITE BACK UP

### SATELLITE BACK UP SERVICE

HISPASAT has designed a service for those companies which require operational and business back up that guarantees availability of communications networks.

Natural disasters and local conflicts can disable physical communication lines, as they may affect terrestrial communications infrastructures. The use of HISPASAT satellite back up line ensures continuous connectivity that guarantees the proper business operation without any interruption.

#### Permanent space capacity:

- Resource sharing: all nodes in the terrestrial network share a dedicated space capacity, which is dynamically assigned to those centrals that require it.
- Bandwidth dynamic management: automatic reconfiguration of space capacity, depending on network traffic demand.
- Modular and adaptive growth: point expansion and reduction, point set-up, etc.

#### Occasional space capacity:

- The service is occasional, with on demand guaranteed bandwidth.
- The customer pays a recurring fee that ensures the use of capacity when required.
